

Data Preparation

1. The dataset was imported into Tableau Public using Microsoft Excel as the data source.
2. The structure of the dataset was reviewed to understand the attributes and records.
3. Data types for numerical and categorical fields were verified in Tableau.
4. Missing and null values were checked to ensure data consistency.
5. Column names were reviewed and standardized where required.
6. The dataset was prepared for visualization by ensuring clean and structured data.
7. Calculated fields were created during the visualization phase for analysis.
